

ABOUT THE TIMKEN COMPANY

As a global leader in bearings and power transmission systems, Timken focuses on precise solution design, materials and craftsmanship to deliver reliable and efficient performance that improves productivity and uptime. Timken offers a full range of bearings, belts, chains, couplings, gears and lubricants, along with rebuild and repair services.

Timken (NYSE: TKR; www.timken.com) applies its proven expertise in metallurgy, tribology and mechanical power transmission to create innovative approaches to customers' complex needs. Global availability of products and engineering talent, combined with exceptional service delivery across markets, makes Timken a preferred choice worldwide.

To view more Timken catalogs, go to www.timken.com/catalogs for interactive versions, or to download our catalog app to your smart phone or mobile device.

TIMKEN® MOUNTED TAPERED ROLLER BEARINGS

BEAT EXPECTATIONS. EXCEED STANDARDS.

In the harshest, most demanding operating conditions, industrial applications need product that can manage high axial and radial loads while avoiding contamination. Timken® Type E and Self-Aligning Mounted Tapered Roller Bearings, also known as housed units, can meet these challenges head-on.

You gain a product with a better load carrying capacity than industry standard tapered roller bearing designs. This makes our Type E and self-aligning mounted bearings an ideal fit for industries like pulp and paper, power generation, mining, cement and aggregate.

TYPE E MOUNTED TAPERED ROLLER BEARINGS

Timken Type E Mounted Tapered Roller Bearings feature enhanced core components that can help reduce maintenance costs, increase uptime and lower overall cost of ownership. They include:

- High performance seals offering better grease retention and protection against mud, water and salt ingress
- Locking collars providing maximum corrosion resistance, better locking power and less set screw back-out, even in severe applications
- E-coated housings featuring superior corrosion resistance over black oxide or powder coating, and interchangeable bolt holes and shaft centerline dimensions
- Premium tapered roller bearing delivering longer bearing life and better performance

TIMKEN SELF-ALIGNING MOUNTED TAPERED ROLLER BEARINGS

Timken Self-Aligning Mounted Tapered Roller Bearings are built better from the inside out. They offer lower bearing operating temperatures, improved lube film thickness and reduced internal stresses thanks to:

- Steel cartridges designed to accept +/- 4 degrees of misalignment
- Cast steel housings which can accept secondary sealing covers
- Powder-coated housings and E coated collars that can protect against corrosion
- Timken tapered roller bearings yielding a design life that is 47% higher than leading competitors
- Optimized bearing profiles and improved surface finishes

Self-Aligning Mounted Tapered Roller Bearings are available in two-bolt pillow block sizes 1 3/16 - 3 1/2 in. (35-90 mm) and in four-bolt pillow block sizes 2 1/4 - 5 in. (60-125 mm).

And with the most robust sealing system in the industry, both Type E and self-aligning mounted bearings can last longer against contamination and moisture.

TIMKEN TYPE E MOUNTED TAPERED ROLLER BEARING SECONDARY SEALING SYSTEM

Unlock premium performance with an unrivaled multi-point internal and external sealing solution. Our full range of end covers protects bearings and improves grease retention. Users reported significantly increased uptime in severely contaminated and wet environments.

- Available in the full range of units from 1 3/16 in. to 7 in. and 35 mm to 180 mm.
- Outboard contact lip provides initial protection from ingress and inboard contact lip provides secondary protection.
- A triple barrier internal seal withstands abrasion and keeps

bearings performing even in harsh, dirty environments.

- Rugged, cost effective covers are designed to fight heavy contamination in industries where particulates are a challenge.
- All units can accommodate end covers, which can be purchased separately.

UNRIVALED MULTI-POINT SEALING SYSTEM

Upgraded triple-barrier internal bearing seal <ul style="list-style-type: none"> • Two contact lips and one rigid middle labyrinth section to help retain grease and reduce contamination ingress • New enhanced seal material to provide greater performance with two times more abrasion resistance than the industry standard nitrile seal 	Locking collar	Grease in cavity of end cover	Triple-lip external rubber through shaft seal	External secondary cover
3	1	1	3	1

<ul style="list-style-type: none"> • Two contact lips and one rigid middle labyrinth section to help retain grease and reduce contamination ingress • New enhanced seal material to provide greater performance with two times more abrasion resistance than the industry standard nitrile seal 	Full grease pack in cover (all covers have grease zerks)	Single lip Teflon through Shaft Seal	External through shaft cover (steel)
3	1	1	1

HOW TO USE THIS CATALOG

We designed this catalog to help you find the Timken bearings best suited to your equipment needs and specifications.

This publication contains dimensions, tolerances and load ratings, as well as engineering sections describing fitting practices for shafts and housings, internal clearances and other bearing features. For more information, please use the Timken Engineering Manual (order no. 10424). It provides valuable assistance in the initial consideration of the type and characteristics of the bearings that may best suit your particular needs.

Updates are made periodically to this catalog. Visit www.timken.com/catalogs for the most recent version of the Timken® Mounted Tapered Roller Bearing Catalog.

SHELF LIFE AND STORAGE OF GREASE-LUBRICATED BEARINGS AND COMPONENTS

To help you get the most value from our products, Timken provides guidelines for the shelf life of grease-lubricated ball and roller bearings, components and assemblies. Shelf life information is based on Timken and industry test data and experience.

SHELF LIFE

Shelf life should be distinguished from lubricated bearing and component design life as follows:

Shelf life of the grease-lubricated bearing and component represents the period of time prior to use or installation.

The shelf life is a portion of the anticipated aggregate design life. It is impossible to accurately predict design life due to variations in lubricant bleed rates, oil migration, operating conditions, installation conditions, temperature, humidity and extended storage.

TIMKEN IS NOT RESPONSIBLE FOR THE SHELF LIFE OF ANY BEARING/COMPONENT LUBRICATED BY ANOTHER PARTY.

European REACH compliance

Timken lubricants, greases and similar products sold in standalone containers or delivery systems are subject to the European REACH (Registration, Evaluation, Authorization and Restriction of CHemicals) directive. For import into the European Union, Timken can sell and provide only those lubricants and greases that are registered with ECHA (European CHemical Agency). For further information, please contact your Timken engineer.

STORAGE

Timken suggests the following storage guidelines for our finished products (bearings, components and assemblies, referred to as “products”):

- Unless directed otherwise by Timken, products should be kept in their original packaging until they are ready to be placed into service.
- Do not remove or alter any labels or stencil markings on the packaging.
- Products should be stored in such a way that the packaging is not pierced, crushed or otherwise damaged.
- After removing the product from its packaging, cleaning is suggested just before installation for certain food and beverage applications.
- When removing a product that is not individually packaged from a bulk pack container, the container should be resealed immediately after the product is removed.
- Do not use product that has exceeded its shelf life as defined in the Timken shelf life guidelines statement.
- The storage area temperature should be maintained between 0° C (32° F) and 40° C (104° F); temperature fluctuations should be minimized.
- The relative humidity should be maintained below 60 percent and the surfaces should be dry.
- The storage area should be kept free from airborne contaminants such as, but not limited to dust, dirt, harmful vapors, etc.
- The storage area should be isolated from undue vibration.
- Extreme conditions of any kind should be avoided.

Due to the fact that Timken is not familiar with your particular storage conditions, we strongly suggest following these guidelines. However, you may be required by circumstances or applicable government requirements to adhere to stricter storage requirements.

Most bearing components typically ship protected with a corrosion-preventive compound that is not a lubricant. These components may be used in oil-lubricated applications without removal of the corrosion-preventive compound. When using some specialized grease lubrications, we advise you to remove the corrosion-preventive compound before packing the bearing components with suitable grease.

Be careful in selecting lubrication, however, since different lubricants are often incompatible.

When you receive a bearing shipment, do not remove products from their packaging until they are ready for mounting so they do not become corroded or contaminated.

Store bearings and bearing housings in an appropriate atmosphere so they remain protected for the intended period.

**WARNING**

Failure to observe the following warnings could create a risk of death or serious injury.

Proper maintenance and handling practices are critical. Failure to follow selection recommendations and installation instructions and to maintain proper lubrication can result in equipment failure.

Overheated bearings can ignite explosive atmospheres. Special care must be taken to properly select, install, maintain, and lubricate mounted unit bearings that are used in or near atmospheres that may contain explosive levels of combustible gases or accumulations of dust such as from grain, coal, or other combustible materials. Consult your equipment designer or supplier for installation and maintenance instructions.

**CAUTION**

Failure to follow these cautions could create a risk of injury.

Do not use damaged mounted bearings. The use of a damaged mounted bearing can result in equipment damage and/or injury.

CAUTION

Failure to follow these cautions may result in property damage.

If hammer and bar are used for installation or removal of a part, use a mild steel bar (e.g., 1010 or 1020 grade). Mild steel bars are less likely to cause release of high-speed fragments from the hammer, bar or the part being removed.

NOTE

Do not use excessive force when mounting or dismantling the unit.

Follow all tolerance, fit, and torque recommendations.

Always follow the Original Equipment Manufacturer's installation and maintenance guidelines.

Ensure proper alignment.

Never weld mounted units.

Do not heat components with an open flame.

Do not operate at bearing temperatures above 121° C (250° F).

Warnings for this product line are in this catalog and posted on www.timken.com/en-us/products/warnings/Pages/TimkenHousedUnitWarnings.aspx.

ENGINEERING

Tapered roller bearings can manage broad ranges of speed and many combinations of radial and thrust loads. Other important environmental conditions affect bearing operation, such as low and high temperature, dust and dirt, moisture and unusual mounting conditions.

This engineering section is not intended to be comprehensive, but does serve as a useful guide when selecting Type E mounted bearings.

To view the complete engineering catalog, please visit www.timken.com. To order the catalog, please contact your Timken engineer and request a copy of the Timken Engineering Manual, order number 10424.

PRODUCT INFORMATION

TIMKEN-DESIGNED TRIPLE-LIP BARRIER SEALS

Features

- Triple-lip design
- Designed to optimize lip contact

Benefits

- Improved grease retention
- Significantly reduced contaminant ingress
- Rotating collar acts as an initial flinger
- Enhanced seal material to provide greater performance with two times more abrasion resistance than the industry standard nitrile seal

COLLAR

Features

- Electrodeposition coating (E-coat)
- 65-degree set screw angle for maximum locking power and greatly reduced set screw back out
- Set screw
- Machined steel

Benefits

- Better corrosion-resistance than black oxide and powder-coating
- All surfaces are protected with E-coat for superior corrosion protection
- Increased locking power
- Greatly reduced set screw back out even in the most severe applications

PREMIUM TIMKEN® TAPERED ROLLER BEARING

Features

- 25 percent more load capacity
- Optimized bearing profiles
- Improved surface finishes
- Super-clean, high-alloy bearing steel

Benefits

- 113 percent increased calculated life over standard Timken® bearings
- Up to three-times greater misalignment capability than standard Timken bearings
- Improved lubrication performance
- Reduced internal stresses
- Enhanced performance

HOUSING

Features

- Electrodeposition coating (E-coat)
- Material spec: ASTM –A48 grade 30 cast iron

Benefits

- Better corrosion resistance than black oxide or powder coating
- Designed to Type E dimensions
- Bolt holes and shaft centerline dimensions interchangeable, conforming with industry practice

Fig. 1. Self-aligning mounted tapered roller bearings.

Fig. 2. Self-Aligning Mounted Tapered Roller Bearing.

SIZE RANGE AND CONFIGURATION

Timken Type E mounted tapered bearings are available in a wide variety of sizes and configurations.

TABLE 1. TYPE E MOUNTED TAPERED ROLLER BEARING SHAFT SIZES AND RANGES

Mounted Unit Configuration	Inches (in.)	Metric (mm)
Pillow Block: Two-Bolt Base	1 3/8 thru 3 1/2	35 thru 90
Pillow Block: Four-Bolt Base	2 1/4 thru 7	60 thru 180
Flange: Four-Bolt	1 3/8 thru 4 1/2	35 thru 115

Pillow Block: Four-Bolt Base	2 1/4 thru 5	60 thru 125
Flange: Four-Bolt	1 3/8 thru 4 1/2	35 thru 115

BEARING SELECTION AND LIFE CALCULATIONS

Many different performance criteria exist that dictate how a bearing should be selected. These criteria include bearing fatigue life, rotational precision, power requirements, temperature limits, speed capabilities, sound and more. The life can also be limited by other system components such as the shaft, shaft interface and the housing. This section deals primarily with bearing life as related to material associated fatigue. The standard mounted tapered roller bearing seal is rated for up to 250° F.

BEARING LIFE

Bearing life is defined here as the length of time, or number of revolutions, until a fatigue spall of 6 mm² (0.01 in.²) develops. Since metal fatigue is a statistical phenomenon, the life of an individual bearing is impossible to precisely predetermine. Bearings that may appear to be identical can exhibit considerable life scatter when tested under identical conditions. Thus, it is necessary to base life predictions on a statistical evaluation of a large number of bearings operating under similar conditions. The Weibull distribution function is commonly used to predict the life of a population of bearings at any given reliability level.

RATING LIFE

Rating life, (L₁₀), is the life that 90 percent of a group of apparently identical bearings will complete or exceed before a fatigue spall develops. The L₁₀ life also is associated with 90 percent reliability for a single bearing under a certain load.

BEARING LIFE EQUATIONS

The L₁₀ life has been calculated as follows for bearings under radial or combined loading where the dynamic equivalent radial load, (P_r), has been determined.

Tapered roller bearings often use a dynamic load rating (C₉₀) based on 90 million cycles, yielding the equations as follows:

$$L_{10} = \left(\frac{C_{90}}{P_r} \right)^{10/3} (90 \times 10^6) \text{ revolutions}$$

or based on shaft speed, (RPM),

$$L_{10} = \left(\frac{C_{90}}{P_r} \right)^{10/3} \left(\frac{90 \times 10^6}{60n} \right) \text{ hours}$$

Timken has expanded standard life equations to include certain additional variables that can affect bearing performance. The approach that considers these factors in bearing analysis and selection has been termed Bearing Systems Analysis (BSA).

The Timken expanded bearing life equation for tapered roller bearings is:

$$L_{na} = a_1 a_2 a_{3d} a_{3k} a_{3l} a_{3m} a_{3p} \left(\frac{C_{90}}{P_r} \right)^{10/3} \left(\frac{90 \times 10^6}{60n} \right) \text{ hours}$$

Where,

- a₁ = Reliability life factor
- a₂ = Material life factor
- a_{3d} = Debris life factor
- a_{3k} = Load zone life factor
- a_{3l} = Lubrication life factor
- a_{3m} = Misalignment life factor
- a_{3p} = Low-load life factor

More details on Life Adjustment Factors can be found in the Timken Engineering Manual (order no. 10424) available on timken.com or by contacting a Timken engineer.

Other factors that can be taken into account within the simple bearing life equation are shock or vibration. These are known to occur in many industrial applications due to combined factors including imbalanced dynamic forces, abusive handling, equipment misuse or neglect. These are difficult to predict.

When these conditions are known or suspected to occur, we suggest that equipment designers use a multiplication factor of (1.5 x P_r) to estimate effects on mounted unit selection and system reliability. Performance testing or advanced analysis is strongly suggested to validate final product selection.

TIMKEN® MOUNTED ROLLER BEARING SELECTION

The double extended tapered roller bearings used in the Type E mounted tapered roller bearings are suited for carrying radial, thrust or a combination of both types of loading. This section will describe the bearing selection process using different methods based on selection criteria and application details.

METHOD 1 – SELECTION TABLE (RADIAL LOADS ONLY)

Note: Based on reference conditions with adequate lubrication.

Determine criteria for bearing selection:

- L_{10} life required.
- Size of bearing based on shaft size (if known).
- Loading conditions (radial) of the application.
- Shaft speed measured by revolutions per minute (RPM).

Use table 3:

- Find speed criteria on upper row.
- Proceed in the column directly below that speed to the equivalent radial load (P_r) that is equal to or greater than that required.
- Follow that row to the left to determine what the minimum shaft size should be for the required L_{10} life (hours). Many values are listed to help in selecting the proper bearing.

METHOD 2 – USING BEARING LIFE EQUATION TO SELECT BEARING FOR A DIFFERENT L_{10} LIFE (RADIAL LOADS ONLY)

If a different life is required than what is found in table 3, it can be calculated from the bearing life equation. Note that each value in the selection table was calculated using this equation. The equation can be rewritten based on the unknown value.

Take the bearing life equation shown previously:

$$L_{10} = \left(\frac{C_{90}}{P_r} \right)^{10/3} \left(\frac{90 \times 10^6}{60n} \right) \text{ hours}$$

Or rewritten as:

$$L_{10} = \left(\frac{C_{90}}{P_r} \right)^{10/3} \left(\frac{1500000}{n} \right) \text{ hours}$$

After calculating the C_{90} , check table 4 to determine the shaft size needed. (Note: Ensure that the application speed does not exceed the maximum RPM found on that same table). Check the radial load, as well, with regard to the maximum allowable slip-fit radial load (F_{r-max} , see table 6). If this value is exceeded, then a tighter line-to-line or press fit is required.

TIMKEN METHOD 3A – DETERMINE EQUIVALENT RADIAL LOADS AND USE BEARING LIFE EQUATION (FOR COMBINED RADIAL- AND THRUST-LOADED APPLICATIONS)

For combined radial- and thrust-loaded applications, it is necessary to calculate an equivalent dynamic radial bearing load, designated by P_r , before applying the L_{10} bearing life equation. The dynamic equivalent radial load is defined as a single radial load that, if applied to the bearing, will result in the same life as the combined loading under which the bearing operates.

Tapered roller bearings are ideally suited to carrying all types of loads – radial, thrust and any combination of both. Due to the tapered design of the bearing, a radial load will induce a thrust reaction that must be opposed by an equal or greater thrust load to keep the bearing cone and cup from separating.

The ratio of the radial to the thrust load and the bearing included cup angle determine the load zone in a given bearing and the number of rollers in contact in the load zone in the bearing. If all the rollers are in contact, the load zone is referred to as being 360 degrees. When only radial load is applied to a tapered roller bearing – for convenience it is assumed in using the traditional calculation method that half the rollers support the load – the load zone is 180 degrees.

For Type E mounted tapered bearings with no external thrust load ($F_a = 0$), the dynamic equivalent radial load (P_r) equals F_r . This P_r value can then be used in the bearing life equation shown on page 10.

For Type E units with thrust loading, table 3 can be used. In this table, only bearing A has an applied thrust load. If bearing B has the applied thrust load, each A in the equations should be replaced by a B and vice versa.

The equations in the first row of table 3 yield single-row equivalent radial loads (P_{rA} and P_{rB}). To find the two-row (Type E mounted unit) life, the following equations must be used to solve for L_{10} life of each bearing row, and then combined for the system unit life:

$$L_{10A} = \left(\frac{C_{90}}{1.74 \times P_{rA}} \right)^{10/3} \left(\frac{1500000}{n} \right) \text{ hours}$$

and,

$$L_{10B} = \left(\frac{C_{90}}{1.74 \times P_{rB}} \right)^{10/3} \left(\frac{1500000}{n} \right) \text{ hours}$$

then,

$$L_{10} = \left[\left(\frac{1}{L_{10A}} \right)^{3/2} + \left(\frac{1}{L_{10B}} \right)^{3/2} \right]^{-2/3} \text{ hours}$$

In the second row of table 3, $P_{rB} = 0$; therefore, $P_{rA} = P_r$ in the standard bearing life equation shown on page 10.

ISO METHOD 3B

The ISO Method uses the following equation to determine the equivalent dynamic radial load:

$$P_r = XF_r + YF_a$$

Where,

P_r = Dynamic equivalent radial load

F_r = Applied radial load

F_a = Applied axial load

X = Radial load factor

Y = Axial load factor

The values for X and Y are found in table 6. In order to find these values, the value of F_r / F_a must be compared to the e value. Determine if the value is greater than or less than the e and then use the corresponding X and Y values below that formula.

After the P_r value is calculated, then use the bearing life equation as shown on page 10.

ISO METHOD 4 – (THRUST ONLY APPLICATIONS)

Use the equation $P_r = YF_a$. Use Y from table 6 (for $F_a / F_r > e$). Then use this P_r value for the equivalent radial load in the bearing life equation. This value can also be used as the radial load in the load rating selection table 5.

After selection has been made, verify that the application does not exceed the maximum allowable speed, allowable thrust loads and allowable housing loads. Heavy loads should be directed through the base of the units. See table 5 for housing ratings for loads applied upward through the top of the mounted unit perpendicular to the shaft axis. The housings need to be bolted down with adequate strength.

TABLE 3.
DYNAMIC EQUIVALENT RADIAL LOAD CALCULATIONS

Design	Thrust Condition	Dynamic Equivalent Radial Load
	$F_a \leq \frac{0.6 F_r}{K}$	$P_{rA} = 0.5 F_r + 0.83 K F_a$ $P_{rB} = 0.5 F_r - 0.83 K F_a$
	$F_a > \frac{0.6 F_r}{K}$	$P_{rA} = 0.4 F_r + K F_a$ $P_{rB} = 0$

LOAD AND SPEED RATING TABLES

The table below shows the allowable equivalent radial load for a given shaft size, speed, and L_{10} life under normal operating conditions with adequate lubrication. Refer to the discussion on the previous pages of this catalog to determine the criteria for combinations not shown in this table or for combined load applications.

NOTE

The shaded area in this table indicates radial loads that exceed the maximum allowable slip-fit radial load (F_r -max). Operation at these conditions may require line-to-line (g6 or h6) or light press fit (m6) on the shaft.

TABLE 4.

HOUSING RATINGS

TABLE 5. HOUSING RATINGS – TYPE E PILLOW BLOCKS: TWO-BOLT BASE, FOUR-BOLT BASE

Shaft Dia.		Maximum Housing Rating Gray Iron at 180°
in.	mm	lbs.
1 3/16 thru 1 1/4		1600
1 3/8 thru 1 7/16	35	3150
1 1/2 thru 1 11/16	40	3000
1 3/4 thru 2	45 thru 50	5150
2 3/16	55	3500
2 1/4 thru 2 1/2	60 thru 65	6550
2 11/16 thru 3	70 thru 75	7000
3 3/16 thru 3 1/2	80 thru 90	15700
3 15/16 thru 4	100	16250
4 7/16 thru 4 1/2	110 thru 115	21000
4 15/16 thru 5	125	22860
5 7/16 thru 6	135 thru 150	50900
6 7/16 thru 7	170 thru 180	

These ratings have been calculated for initial bearing selection. These include a nominal safety factor for the standard Type E two- and four-bolt pillow blocks. The following conditions apply: standard cast-iron material, the force is applied perpendicular to the shaft axis, and the housing bolts are properly clamped.

These limits should not be applied to operating conditions that include impact (shock) loads or combined radial and thrust loads that are not directed into the pillow block base.

If heavy cap loads are expected, use the following modifications to mounting method or equipment design: Grade 8 base bolts and hardened washers; ensure that proper installation torque is achieved and is uniform.

If axial loads are expected, provide mechanical stops or shear bars with strength sufficient to support the load. Specification of the strength, material, method of fastening, and precision location are the responsibility of the machinery designer.

TABLE 6.
TAPERED ROLLER BEARING – RADIAL AND THRUST FACTORS; SPEED AND SLIP-FIT LOAD LIMITS

⁽¹⁾ C_{90} is the dynamic load rating based on a rated life of 90 million revolutions (3000 hrs. at 500 RPM).

⁽²⁾ F_{a-max} is based on the limits of the holding force of two properly tightened collars and set screws. When a single collar is installed, 50 percent of the values should be used.

⁽³⁾Triple-lip barrier seal.

⁽⁴⁾Operating at conditions where loads approach or exceed F_{r-max} may require line-to-line (g6 or h6) or light press-fit (m6) on the shaft.

NOTE: The maximum permissible thrust load applies to conditions of slip-fit with set screw mounting or in applications where a large moment loading occurs. The values shown are valid only when two collars and set screws are used.

NOTE: When heavy thrust forces are applied, the friction between the pillow block and base may not be sufficient to prevent movement. Mechanical stops or shear bars with strength sufficient to support the load should be added. Never weld the pillow block or bearing to secure it to the shaft or base.

TYPE E INSTALLATION AND LUBRICATION INSTALLATION

Proper installation of the mounted unit is necessary. This includes the use of shafts that are clean, free from nicks and burrs, straight and of proper diameter. Follow table 7. The recommended shaft tolerances shown in table 7 are for normal loaded applications. Refer to table 4 to verify the maximum allowable slip-fit radial load (F_{r-max}) and to determine if a tighter fit is required.

Do not mount the bearing on a worn section of the shaft. Use of shafts with hardness greater than HRC 45 will reduce the effectiveness of locking devices.

Also, it is necessary that the mounted units and shafts are in alignment (fig. 4). Verify that the mounting surfaces are in the same flat plane to help make sure good alignment is achieved. If shimming is required to minimize misalignment, use full shims across the entire housing base (fig. 5). The bolts then need to be alternately torqued securely to their mounting supports.

Flat washers should be used when installing any kind of mounted unit (fig. 5). Washers should be properly sized to the bolt diameter. Typically, the diameters of SAE washers are too small to properly cover the bolt slots on the units. After the locking collar(s) are lined up flush with the end of the cone (inner ring) face (fig. 6), apply thread locker as needed to set screws, then tighten properly per table 8. Set screws in multiple units should be aligned to each other (fig. 7).

LUBRICATION

To help maintain a rolling bearing's antifriction characteristics, lubrication is needed to:

- Minimize rolling resistance due to deformation of the rolling elements and raceway under load by separating the mating surfaces.
- Minimize sliding friction occurring between rolling elements, raceways and cage.
- Protect from corrosion and, with grease lubrication, from contaminant ingress.

Bearings have been factory prelubricated with Timken Premium All Purpose Industrial Grease, which is an NLGI No. 2 lithium-complex-based grease. This is suitable for normal operating conditions. Units should be relubricated with the Timken grease or one that is compatible and made for roller bearings.

It is vital that the greases used are compatible. Please consult with a Timken engineer for the grease specifications if the use of a grease other than the Timken grease mentioned above is needed.

Normal service is considered as operation in a clean, dry environment at temperatures between -34°C to $+82^{\circ}\text{C}$ (-30°F and $+180^{\circ}\text{F}$). If service is beyond normal conditions due to speed, temperature or exposure to moisture, dirt or corrosive chemicals, periodic relubrication may be advisable. For extreme conditions or conditions in which special chemicals are used, consult your Timken engineer.

After extended storage or periods when the unit is not in operation, fresh grease should be added.

For units operating in dirty or wet environments, the bearing should contain as much grease as possible, based on the shaft speed, to help protect against contamination. For slower applications, with shaft speeds typically less than 200 RPM, the unit should have additional grease added at start-up to fill the bearing.

Lubrication affects the bearing operating temperature as well. If the bearing does not have enough grease, this could lead to higher temperature operation due to inadequate lubrication film thickness. Excessive grease will lead to higher operating temperatures due to grease churning. This can cause bearing overheating. To avoid this, it may be necessary to remove some of the grease inside the unit. The grease fitting may be removed briefly in this circumstance to allow excess grease to purge. The grease fitting must be put back in place. It is best to observe the bearing and its temperature to adjust the lubrication as needed.

RELUBRICATION CYCLE

Adequate lubrication is an essential element affecting the bearing life. The two primary considerations that determine the relubrication cycle on any application are operating temperature and contamination. Every attempt should be made to maintain seals at peak efficiency.

The higher the temperature, the more rapidly the grease oxidizes. Grease life is reduced by approximately half for every 10° C (18° F) rise in temperature. The higher the operating temperature, the more often the grease must be replenished. Table 9 can be used

as a suggested initial point of reference. Relubrication frequency and quantity intervals are best developed through experience for each application based on types of service, which may differ from the suggestions in table 9.

When the bearing is not in operation for an extended period of time, grease should be added to prevent corrosion.

Table 9 shows general lubrication suggested starting points only. Please read the entire installation instructions prior to using these tables. Applications should be regularly reviewed and lubrication amounts and intervals modified as needed to assure best results.

**TABLE 9.
SUGGESTED RELUBRICATION INTERVALS
(BASED ON EIGHT HOURS/DAY OPERATION)**

Environment	Clean: Un-Exposed			Moderate: Exposed			Extreme: Harsh		
	Low	Med.	Hi	Low	Med.	Hi	Low	Med.	Hi
Application Speed ⁽¹⁾									
Greasing Interval	1 year	2 months	2 weeks	1 month	2 weeks	(2)	1 week	1 week	(2)

⁽¹⁾Low < 25% max RPM; 25% < Med. < 75%; 75% < Hi – See table 5.

⁽²⁾Use extra caution due to heat generation.

Relubrication frequency and quantity are best developed through experience.

At all times, follow Original Equipment Manufacturer's maintenance instructions.

WARNING

Failure to observe the following warnings could create a risk of death or serious injury.

Overheated bearings can ignite explosive atmospheres. Special care must be taken to properly select, install, maintain, and lubricate mounted unit bearings that are used in or near atmospheres that may contain explosive levels of combustible gases or accumulations of dust such from grain, coal, or other combustible materials. Consult your equipment designer or supplier for installation and maintenance instructions.

SELF ALIGNING INSTALLATION AND LUBRICATION

PRODUCT NOTES

1. Self-aligning tapered roller bearing housed units are designed to be installed on the shaft without needing to disassemble the split housing. The unit is ready to install on the shaft out of the box.
2. The bearing is designed for maximum permissible static misalignment of +/-4 degrees. Going in excess of this may result in reduced bearing life.
3. All self-aligning tapered roller bearing housed units come prelubricated with factory grease. There is no need to add grease during installation.

INSTALLATION

1. Proper installation of the housed unit is necessary. This includes the use of shafts that are clean, free from nicks and burrs, straight and of proper diameter. Follow Table 10 for recommended shaft tolerances (those shown in the table are for normal loaded applications). Refer to catalog to verify the maximum allowable slip-fit radial load (Fmax) and to determine if a tighter fit is required. Do not mount the bearing on a worn section of the shaft. The use of shafts with hardness greater than HRC 45 will reduce the effectiveness of the locking collars.
2. If using an open-end cover on the inboard side, slide the open-end cover/seal combination into position on the shaft.
3. Apply a thin oil film to the shaft and bearing bore.
4. Slide the bearing onto the shaft into position starting with the fixed (non-expansion) bearing and then proceeding to the floating (expansion) bearings down the shaft.
 - a. It is necessary to make sure that the housed units and shafts are in alignment (Fig. 8). The self-aligning units come with machined foot ends on the base of the housing to assist with alignment. Verify that the mounting surfaces are in the same flat plane to help make sure good alignment is achieved. If shimming is required to minimize misalignment, use full shims across the entire housing base (Fig. 9).
 - b. Position expansion (floating) bearing assemblies on the mounting surface, then align and tighten base mounting bolts. Do not tighten the housing cap bolts or locking collar set screws at this time. Housing mounting bolts need to be alternately torqued securely to their mounting supports. Flat washers should be used when installing any kind of housed unit (Fig. 9). Washers should be properly sized to the bolt diameter and should not be an SAE grade less than SAE grade 8 or equivalent.
 - c. Position non-expansion (fixed) bearing assemblies in correct relation to the shaft and mounting surface. Tighten base mounting bolts. Do not tighten the housing cap bolts or locking collar set screws at this time. Housing mounting bolts need to be alternately torqued securely to their mounting supports. Flat washers should be used when installing any kind of housed unit (Fig. 9). Washers should be properly sized to the bolt diameter and should not be an SAE grade less than SAE grade 8 or equivalent.
5. Verify the alignment of the fixed (non-expansion) unit. Rotating the bearing by hand without the cap bolts tightened down will help the bearing to accurately align. If it's not possible to rotate by hand - and it's safe to do so - run under power for a short time. Tighten the housing cap bolts to the torque specified in Table 12. Then ensure that the locking collars are lined up flush with the end of the cone (inner ring) face (Fig. 10). Set screws then need to be properly tightened per Table 11 using a cross pattern. Set screws in multiple units should be aligned to each other (Fig. 11).
6. Locate the first float (expansion) unit closest to fixed bearing and begin setting and locking expansion bearings from closest to fixed out. Locate the cartridge of the expansion unit in the center of its axial travel or at extreme if maximum expansion is required (do not preload anti-rotation washer/grease fitting against the access slot in the top of the housing). Verify the alignment of the unit. Rotating the bearing by hand without the cap bolts tightened down will help the bearing to accurately align. If it's not possible to rotate by hand - and it is safe to do so - run the unit for a short time. Tighten the cap bolts to the torque specified in Table 12. Then ensure that the locking collars are lined up flush with the end of the cone (inner ring) face (Fig. 10). Set screws then need to be properly tightened per Table 11 using a cross pattern. Set screws in multiple units should be aligned to each other (Fig. 11). Then move to the next float (expansion) bearing in line and repeat step 6.
7. If using covers, complete the inboard cover installation and any outboard cover installations per the installation guide provided with the covers.

Fig. 9.

Fig. 10.

Fig. 11. Line up set screws in multiple units.

REPLACING CARTRIDGE ASSEMBLY IN SELF-ALIGNING HOUSED UNIT ASSEMBLY

1. The self-aligning housings are serialized as matched sets (caps and bases). When reassembling the cap and base, ensure that the serial numbers match.
2. Remove old cartridge bearing assembly. Then clean and inspect the cap and base housing bore for any damage. Installing replacement cartridge assemblies into a damaged housing may result in reduced bearing life.
3. Apply a film of anti-seize compound to the spherical bore of the cap and base of the housing.
4. Insert the cartridge assembly to the bolted base:
 - a. For non-expansion (fixed), drop the cartridge assembly into the base with the grease fitting facing towards the top of the housing.
 - b. For expansion (float), place the cartridge assembly into the base with the grease fitting facing towards the top of the housing. If the float required is centered, then there will be 6.6 mm (0.26 in.) float available on each side, and the cartridge should be installed at the center of the housing. If the float required is more than 6.6 mm (0.26 in.) toward the one end, the cartridge would be placed in the opposite side with additional expansion from the center of housing.
5. Install the pre-matched cap lining up the dowels with the dowel holes in the base. Then loosely tighten the cap bolts.
6. Then follow the housed unit installation instructions on page 19 for final installation.

LUBRICATION

This information is to aid in the proper lubrication of Timken tapered roller bearing housed units for the majority of applications.

Bearings have been factory prelubricated with Timken® Premium All Purpose Industrial Grease, which is an NLGI No. 2 lithium complex based grease. This is suitable for normal operating conditions. Units should be relubricated with the Timken grease or one that is compatible and made for roller bearings. **It is vital that the greases used are compatible. Please consult with a Timken representative for the grease specifications if the use of a grease other than the Timken grease mentioned above is needed.**

Normal service is considered as operation in a clean, dry environment at temperatures between -34° C to +82° C (-30° F and +180° F). If service is beyond normal conditions due to speed, temperature, or exposure to moisture, dirt or corrosive chemicals, periodic relubrication may be advisable. For extreme conditions or conditions in which special chemicals are used, a Timken representative should be consulted.

After extended storage or periods when the unit is not in operation, fresh grease should be added.

For units operating in dirty or wet environments, the bearing should contain as much grease as possible, based on the shaft speed, to help protect against contamination. For slower applications, with shaft speeds typically less than 200 RPM, the unit should have grease added at start-up to fill the bearing.

Lubrication affects the bearing operating temperature as well. If the bearing does not have enough grease, this could lead to higher temperature operation due to inadequate lubrication film thickness. Excessive grease will lead to higher operating temperatures due to grease churning. This can cause bearing overheating. To avoid this, it may be necessary to remove some of the grease inside the unit. The grease fitting may be removed briefly in this circumstance to allow excess grease to purge (the grease fitting must be replaced). It is best to observe the bearing and its temperature and adjust the lubrication as needed.

RELUBRICATION

Grease fitting for relubrication is located under the part number tag (Fig. 8).

Adequate lubrication is an essential element to the bearing life. Table 13, shown below, can be used as a suggested initial point of reference. Relubrication frequency and quantity intervals are best developed through experience for each application, based on types of service, which may differ from the suggestions in the table. When the bearing is not in operation for an extended period of time, grease should be added to prevent corrosion.

The recommended shaft tolerances in Table 10, shown on page 20, are for normal loaded applications. Please refer to the engineering section in the Timken Tapered Roller Bearing Housed Unit Catalog (Order no. 10481) to verify the maximum allowable slip fit radial load and to determine if a tighter fit is required. Table 13 shows general lubrication suggested starting points only. Please read the entire installation instructions prior to using these tables. Applications should be regularly reviewed and lubrication amounts and intervals modified as needed to assure best results.

**TABLE 13. SUGGESTED RELUBRICATION INTERVALS

TAPERED ROLLER BEARING
PRODUCT DATA TABLES**

The following tables include product specification information for Timken® Self-Aligning Mounted Tapered Roller Bearings. Contact your Timken engineer for more information.

Nomenclature 40

Type E Self-Aligning (ESA) Mounted Tapered
Roller Bearing Pillow Block: Two-Bolt Base 42

 Single Locking Collar 42

 Double Locking Collar 43

Type E Self-Aligning (ESA) Mounted Tapered
Roller Bearing Pillow Block: Four-Bolt Base 44

 Single Locking Collar 44

 Double Locking Collar 45

Type E Self-Aligning (ESA) Mounted Tapered
Roller Bearing: Four-Bolt Flange Block 46

 Single Locking Collar 46

 Double Locking Collar 48

Self-Aligning SAF (SAFSA) Mounted Tapered
Roller Bearing Pillow Block: Two-Bolt Base 50

 Single Locking Collar 50

 Double Locking Collar 52

Self-Aligning SAF (SAFSA) Mounted Tapered
Roller Bearing Pillow Block: Four-Bolt Base 54

 Single Locking Collar 54

 Double Locking Collar 56

Self-Aligning DI (DISA) Mounted Tapered
Roller Bearing Pillow Block: Two-Bolt Base 58

 Double Locking Collar 58

Self-Aligning DI (DISA) Mounted Tapered
Roller Bearing Pillow Block: Four-Bolt Base 60

 Double Locking Collar 60

Self-Aligning Type K (KSA) Mounted Tapered
Roller Bearing Pillow Block: Two-Bolt Base 62

 Single Locking Collar 62

Self-Aligning Type K (KSA) Mounted Tapered
Roller Bearing Pillow Block: Four-Bolt Base 64

 Single Locking Collar 64

Self-Aligning SN (SNSA) Mounted Tapered
Roller Bearing Pillow Block: Two-Bolt Base 66

 Double Locking Collar 66

Self-Aligning SN (SNSA) Mounted Tapered
Roller Bearing Pillow Block: Four-Bolt Base 68

 Double Locking Collar 68

Self-Aligning Mounted Tapered
Roller Bearing Cartridges 70

 Single Locking Collar 70

 Double Locking Collar 72

Self-Aligning Mounted Tapered
Roller Bearing Secondary Covers 74
